

ROBOVIGIL

Watches your machines
so you don't have to

Know things are working — even if you are not.

The whole point of automation is that you don't need to be there. But that only works if you know everything is running smoothly without you.

That's what RoboVigil delivers: Live machine data and camera feeds on your phone, from anywhere, with instant alerts the moment something needs your attention.

How it works

Software-only. Nothing installed on your machines, no proprietary hardware. Uses your existing router and off-the-shelf IP cameras — or an inexpensive 4G security gateway where the factory network isn't an option.

Set up in minutes, not hours or days. Automatic configuration means RoboVigil is reading your machine's data within moments of connecting. Minutes of setup for years of peace of mind.

Secure by design. All machine data travels over an encrypted WireGuard VPN tunnel, connected outbound from your site — no port forwarding, nothing exposed to the internet. And it's monitoring only: RoboVigil reads data from your machines, it never sends commands.

Vendor-agnostic. Talks directly to ABB, Universal Robots and FANUC, with OPC-UA and MQTT for everything else — CNCs, injection moulders, robots, cobots, packaging lines, PLCs. One dashboard, every manufacturer.

Affordable. The big manufacturers built this with control rooms and SCADA budgets. RoboVigil gives you the same oversight for a simple monthly price per machine — no capital expenditure, no installation project.

The Missing Piece

The robots held up their end of the bargain a long time ago. Machines are reliable and do a brilliant job. But for most SMEs, the freedom that automation promised never arrived — because the moment you walk away, nobody knows what the machines are doing. The big manufacturers solve this with control rooms and SCADA budgets. Smaller factories can't spare a person to sit and watch a screen all day.

That's the missing piece of the jigsaw. Not better robots. Not more automation. Just the ability to know, from wherever you are, that your machines are running — and to be told immediately when they're not.

What you get

Phone alerts - No news is good news. When something goes wrong, your phone pings.

Snapshots - The machine's error messages and fault data, plus a camera snapshot of the exact moment.

Visibility - Live camera feeds and machine state in your pocket - only go to the machine when it actually needs you.

Metrics - RoboVigil tracks the numbers: cycle counts, uptime, utilisation — key production information.

If the promise of automation is freedom from the factory floor, the monitoring has to be autonomous too. RoboVigil watches your machines so you don't have to. Be where you want to be, not where your machines are.
